

Algorithm Sample 8

Dataset-expansion sample

1 Procedure

The pseudocode below is drawn from a source-backed image-to-Latex benchmark and reproduced verbatim.

Algorithm 1 Delta Particle Filter

1. Input: data $y_{1:T}$, level $l \in \mathbb{N}$, particle number $N \in \mathbb{N}$ and parameter $\theta \in \Theta$.
2. Initialize: For $i \in \{1, \dots, N\}$, independently generate $\bar{W}_{\Delta_l:1}^{i,l}$ from $\mathcal{N}(0, \Delta_l)$. For $(i, k) \in \{1, \dots, N\} \times \{1, \dots, \Delta_{l-1}^{-1}\}$ set $\bar{W}_{k\Delta_{l-1}}^{i,l-1} = \bar{W}_{2k\Delta_l}^{i,l} + \bar{W}_{(2k-1)\Delta_l}^{i,l}$. Set $t = 1$, $\hat{p}^N(y_{1:0}) = 1$ for convention and go to step 3.
3. Iterate: For $i \in \{1, \dots, N\}$ compute

$$\tilde{u}_t^i = \frac{\max\{\kappa_{t,l}(\bar{w}_{\Delta_l:t}^{i,l}), \kappa_{t,l-1}(\bar{w}_{\Delta_{l-1}:t}^{i,l-1})\}}{\sum_{j=1}^N \max\{\kappa_{t,l}(\bar{w}_{\Delta_l:t}^{j,l}), \kappa_{t,l-1}(\bar{w}_{\Delta_{l-1}:t}^{j,l-1})\}}.$$

Set $\hat{p}^N(y_{1:t}) = \hat{p}^N(y_{1:t-1}) \frac{1}{N} \sum_{i=1}^N \max\{\kappa_{t,l}(\bar{w}_{\Delta_l:t}^{i,l}), \kappa_{t,l-1}(\bar{w}_{\Delta_{l-1}:t}^{i,l-1})\}$. Then sample $(\bar{w}_{\Delta_l:t}^{1:N,l}, \bar{w}_{\Delta_{l-1}:t}^{1:N,l-1})$ with replacement from $(\bar{w}_{\Delta_l:t}^{1:N,l}, \bar{w}_{\Delta_{l-1}:t}^{1:N,l-1})$ using probabilities $\tilde{u}_t^{1:N}$. For $i \in \{1, \dots, N\}$, independently generate $\bar{W}_{t+\Delta_l:t+1}^i$ from $\mathcal{N}(0, \Delta_l)$. For $(i, k) \in \{1, \dots, N\} \times \{1, \dots, \Delta_{l-1}^{-1}\}$ set $\bar{W}_{t+k\Delta_{l-1}}^{i,l-1} = \bar{W}_{t+2k\Delta_l}^{i,l} + \bar{W}_{t+(2k-1)\Delta_l}^{i,l}$. Set $t = t + 1$ and if $t = T$ go to step 4, otherwise restart step 3.

4. Grand Selection: For $i \in \{1, \dots, N\}$ compute $\tilde{u}_T^i = \frac{\max\{\kappa_{T,l}(\bar{w}_{\Delta_l:T}^{i,l}), \kappa_{T,l-1}(\bar{w}_{\Delta_{l-1}:T}^{i,l-1})\}}{\sum_{j=1}^N \max\{\kappa_{T,l}(\bar{w}_{\Delta_l:T}^{j,l}), \kappa_{T,l-1}(\bar{w}_{\Delta_{l-1}:T}^{j,l-1})\}}$. Set $\hat{p}^N(y_{1:T}) = \hat{p}^N(y_{1:T-1}) \frac{1}{N} \sum_{i=1}^N \max\{\kappa_{T,l}(\bar{w}_{\Delta_l:T}^{i,l}), \kappa_{T,l-1}(\bar{w}_{\Delta_{l-1}:T}^{i,l-1})\}$. Sample one $(\bar{w}_{\Delta_l:T}^l, \bar{w}_{\Delta_{l-1}:T}^{l-1})$ from $(\bar{w}_{\Delta_l:T}^{1:N,l}, \bar{w}_{\Delta_{l-1}:T}^{1:N,l-1})$ using $\tilde{u}_T^{1:N}$ and go to step 5.
 5. Output: trajectories $(\bar{w}_{\Delta_l:T}^l, \bar{w}_{\Delta_{l-1}:T}^{l-1})$ and normalizing constant estimate $\hat{p}^N(y_{1:T})$.
