

First Sheet: Suggested Solutions

Learn how to create nice exercise sheets.

Exercise 1

Include an exercise from an external file.

Solution:

I just did this. And this, too.

Lexercise needs LuaL^AT_EX!

Exercise 3

Read the manual.

many, many points

Exercise 4

After you read the manual:

5+1 points

Play around with this example. You might want to read further manuals like:

- (a) pgf (for pgfkeys) *(2 points)*
- (b) enumitem and similar *(1 b.p.)*
 - 1. paralist 2
 - 2. i. varioref
- (c) all the others *(3 points)* (why not?)

Exercise Sheet 2: Suggested Solutions

Exercise 5 Read the manual.

many, many points

Solution:

Oh no, it's quite long. Really long, but please `\relax`. Ok, but my brain feels like:

%
x
\$ t
&

\
#

And yours?

Third Sheet: Suggested Solutions

Exercise 1 Read the manual.

many, many points

Solution:

OK, done.

still done.

Exercise Sheet 5: Suggested Solutions

Exercise 9 Read the manual.

many, many points

Solution:

OK, done (again). Otherwise, I wouldn't know `\newframe` now which does not exist in beamer.

Loading `varioref` enables you to refer to sub-exercises, like this: Did you do 4.c? It is the subexercise 3 and has label (c).

Exercise 10 Play around with the options.

many, many points

Some exercise, there are far too few.

Solution:

This is a dual-use solution with explicit beamer frames (and no framed). Note, that we can freely place the title, because of `defersolutiontitle`.

Exercise 11 Play around with the options.

many, many points

Solution:

This solution is only shown if using the non-beamer version, because the option `beamersolution` was used. Otherwise both solutions would be shown. You can set the option `beamersolution` for individual (normal) solutions to ignore some but not all solutions of an exercise.

Exercise 12

many, many points

The exercise task can be saved and restated.

(a) *first*

Solution:

None (yet).

(b) *second*

I forgot all the tasks! The exercise task can be saved and restated. Yeah, but what about the subtasks? I forgot the first and the second one. Or did I?

Lexercise needs Lua^AT_EX!

Lexercise needs Lua^AT_EX!
