

Some Examples for the LCD package.¹

As seen in the headline and here, the LCD package calculates the size for LCD-text in normal text (`\textLCD`) automaticly. It works for all fontsizes:

MM M LCD M MM tiny	Huge MM M LCD M MM
MM M LCD M MM scriptsize	huge MM M LCD M MM
MM M LCD M MM footnotesize	LARGE MM M LCD M MM
MM M LCD M MM small	Large MM M LCD M MM
MM M LCD M MM normalsize	large MM M LCD M MM

Now let's have some colored `LCD-text`. Here first the colors where set with `\LCDcolors{darkgreen}{lightgreen}`² and then the LCD-text where done with `\textLCD[0]{8}|LCD-text|`. To invert the LCD, just exchange the `colors` (`\LCDcolors{lightgreen}{darkgreen}`).

Now some separte LCD representations. But first let's change the colors to some not as ugly. The LCD was generated with

```
\LCD{4}{18}|LCD representation|
      |made with the LCD |
      |package for LaTeX |
      |04.01.2004 {clock} 18:23|
```

The `{clock}` is a so called multi-letter character. It generates the clock symbol.

As you can see, there is a black colored frame around it. The frame color can be changed with the optional first argument of `\LCDcolors` (`\LCDcolors[red]...`; left part of figure 1). And with `\LCDnoframe` you can disable frames (reenabled with `\LCDframe`; right part of figure 1). Of course `\LCD` works within a figure environment.

Figure 1: Example with red colored frame and without frame

¹The source of this example file is part of `lcd.dtx`.

²The color names where defined with `\definecolor` from the `color` package in the preamble.
